INTRODUCTION

Almost a quarter of young Poles don't know whether they want to leave the country.

Marcos Segador Arrebola

General Director of Gi Group Holding in Poland

For the past few years, the number of Poles interested in economic migration remains at a similarly high level - but the beginning of the year has brought a worrying development: a major increase of undecided respondents. Currently, they account for 24.3% of all answers, while as recently as February 2020 it was merely one percent of all answers.

Who wants to leave and why? Primarily the younger generation - people under 34 years of age, who will remain economically active for years to come, with vocational, secondary and higher education. Should they decide to leave, even if only for a short period, it would have dramatic consequences for the country - after all, we are talking about people who should be driving growth and building Poland's economic structure in the coming years.

The vast majority of respondents considering migration can perceive the effects of the deteriorating economic situation. They are looking for a chance at better earnings, better prospects for professional development, and better living conditions. A key factor influencing their plans to leave is greater respect for freedom abroad and a safer geographical location. The low unemployment and multitude of interesting employment offers in Poland fail to convince the Poles to stay.

They are not discouraged by factors such as the volatility of the global economy or the high unemployment rate in other European countries, which are the most common destination for economic migration.

The increasing willingness of Poles to migrate for work should be viewed in the context of available demographic forecasts, the age structure of the population and professional activity. The so-called demographic winter caused by the aging of the population is already having a perceivable economic impact - the shrinking working-age population means an increase in social expenditures with a simultaneous labor shortage – concerning both lower-ranking and specialist workers. The effects on the economy are already visible and will get worse. Therefore, it is of utmost importance to not only implement a coherent state demographic policy but also to create satisfactory jobs, support the qualification growth of the working population and adapt their competencies to match ongoing technological trends so that they can maintain their employment, as well as to nurture new talent. It's also of considerable importance to adapt the education system to the ever-changing needs of the highly dynamic labor market.

The provided report will illuminate the matter in far greater detail. I invite you to read it.

THE REPORT IN NUMBERS

17%

of Poles consider economic migration within the next 12 months

93%

of those planning to leave can perceive the worsening domestic economic situation

42%

of people interested in migration are rural residents

29%

of those planning to leave are physical or production workers

THE REPORT IN NUMBERS

29%

of people aged 18-24 are planning to migrate

41%

of Poles expect to leave for no longer than half a year

46%

of those considering migration want to take their families with them

35%

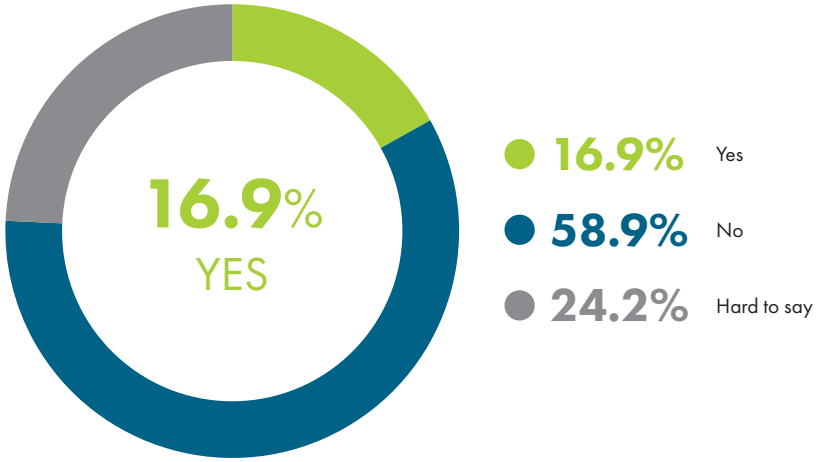
want to migrate to Germany

ECONOMIC MIGRATION PLANS

How many Poles are thinking of emigration?

Almost 17% of all Poles are considering economic migration abroad over the upcoming year. Nearly 60% of them do not declare any plans to migrate. Notably, a high percentage of uncertain respondents (24.2%) – almost a fourth of them is unable to clearly answer the question of migration plans. This could indicate a high uncertainty concerning the socio-economical situation and the adoption of a „wait and see" approach.

Are you considering economic migration within the next 12 months?

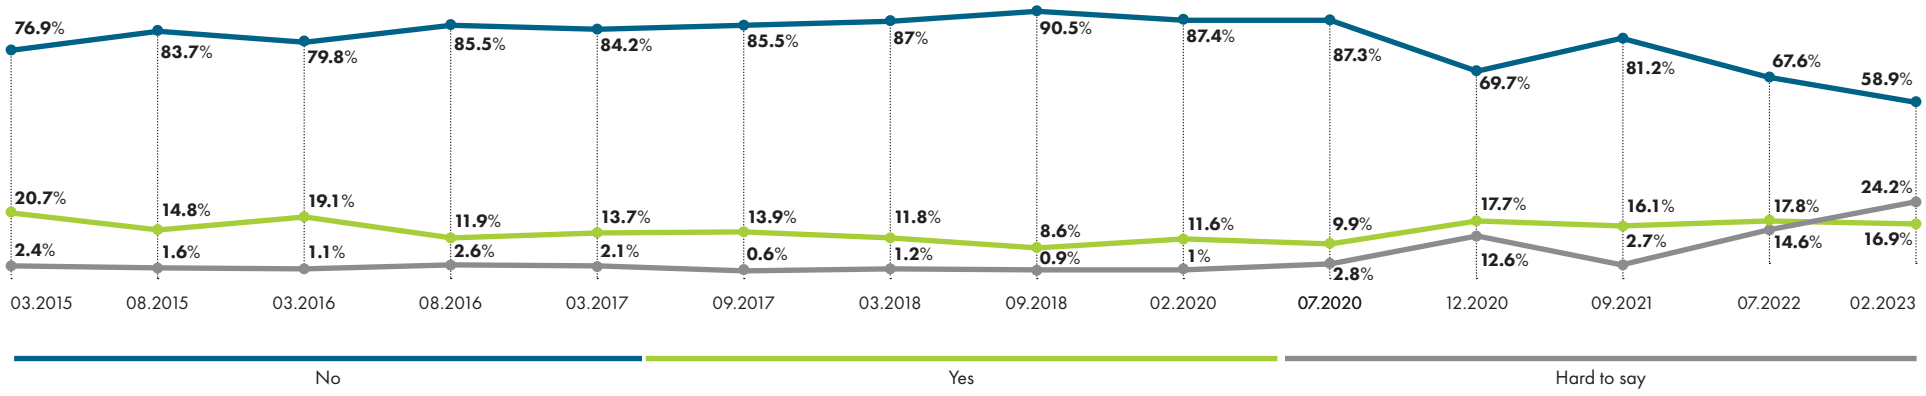


ECONOMIC MIGRATION OF POLES IN TIME

Rising interest in leaving

Over the past three years, we have seen a visible rise in Poles' interest in emigration – earlier, such high indicator levels were only seen in H1 2016. While the percentage of people declaring willingness for economic migration is slightly lower as compared to July 2022 (a decrease of 0.9 p.p.), the number of respondents outright declining the possibility has also decreased – by as much as 8.7 p.p. Notably, the percentage of undecided respondents has greatly increased, by almost 10 p.p. as compared to July 2022, reaching the highest level since 2015. The migration interest graph clearly shows that the unstable economic situation brought on by the Covid-19 pandemic and the war in Ukraine remains impactful on the willingness of Poles to emigrate.

Are you considering economic migration within the next 12 months?
Economic migration of Poles in time



WHO PLANS TO MIGRATE ECONOMICALLY?

The youth are more interested in leaving

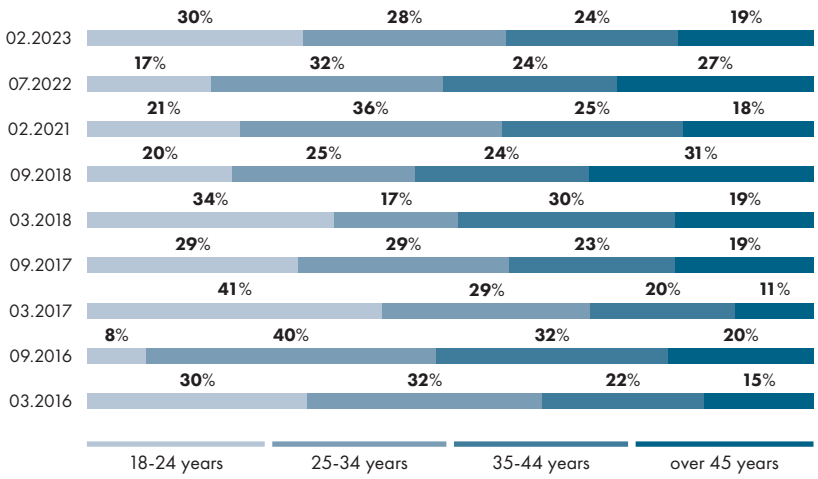
Who is considering economic emigration? Primarily younger people, with half of the potential migrants belonging to the 25-44 age group (52%) and a further third to the 18-24 group (30%). Compared to the last year, the structure of people interested in leaving has changed – with a notable increase of interest among the youngest, below 24 years of age (+13 p.p.) and an 8 p.p. decrease among the oldest group, aged 45-67.

When looking at the distribution of answers in various age groups, the highest interest can be seen among the youth under 24 years of age. This group has both the highest share of people declaring plans to emigrate (28.9%) and the lowest share of those rejecting them (40.5%). The share of undecided respondents also remains high – comprising almost a third of people aged 18-24.

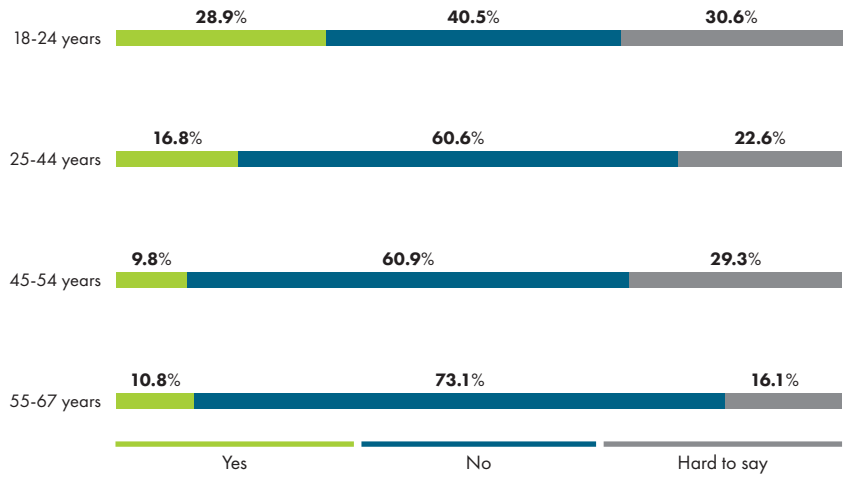
The willingness to migrate is also decreasing with age – the lowest share of hypothetical migrants belongs to the 45-54 age group (9.8%), though even there we can find a high percentage of undecided respondents. People over 55 years of age are the most common to reject the possibility of a leave – with as many as 73.1% declining such plans outright.

Are you considering economic migration within the next 12 months?

People considering economic migration - age



Migration plans in different age groups



WHO PLANS TO MIGRATE ECONOMICALLY?

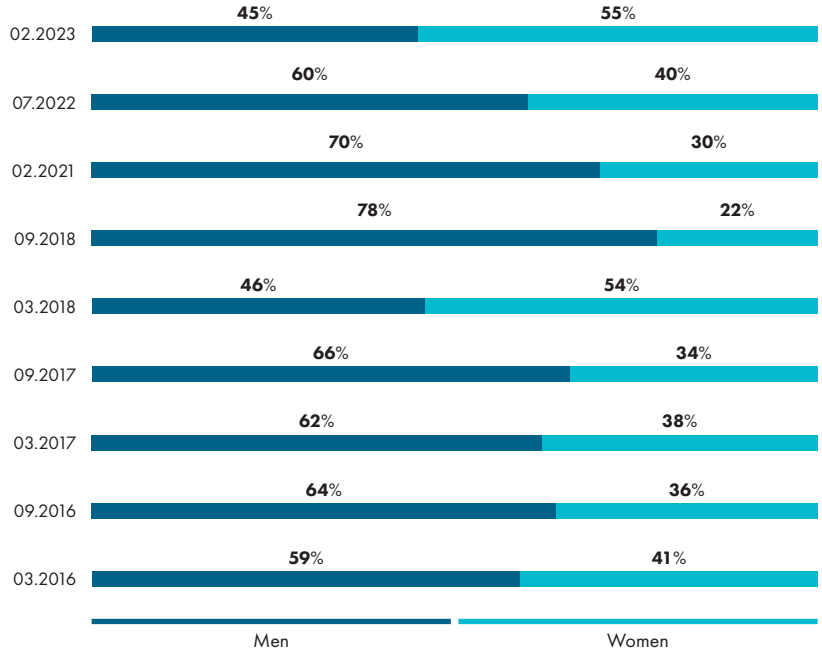
The women are predominant

Women are the predominant group among those considering migration – they constitute over half of all respondents declaring willingness to emigrate (an increase of 15 p.p. as compared to 2022 and of 25 p.p. as compared to 2021). It bears mentioning that over the past seven years, we have only seen such proportions once – usually, it is men who are more willing to emigrate abroad.

Are you considering economic migration within the next 12 months?

People considering economic migration - gender

People considering economic migration - gender



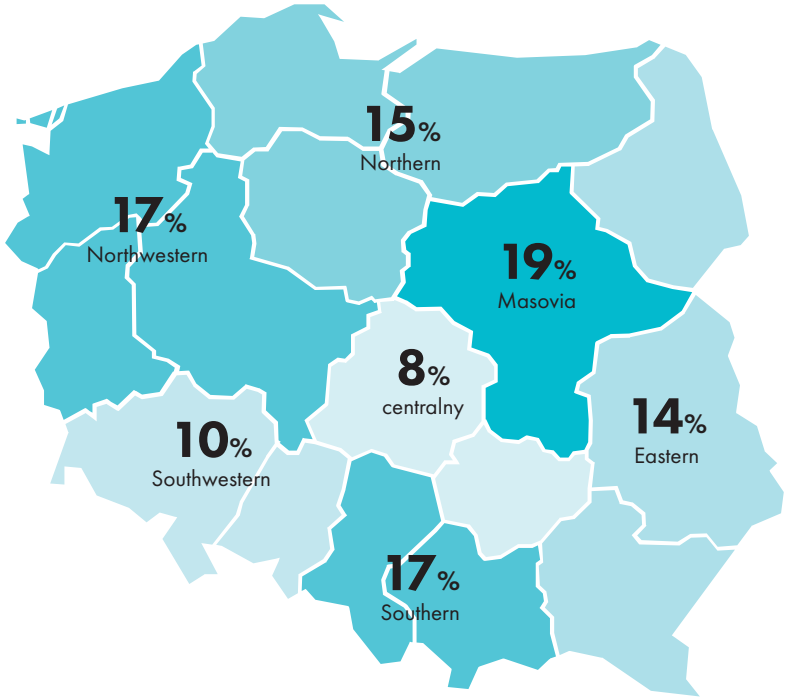
WHO PLANS TO MIGRATE ECONOMICALLY?

No change in most regions

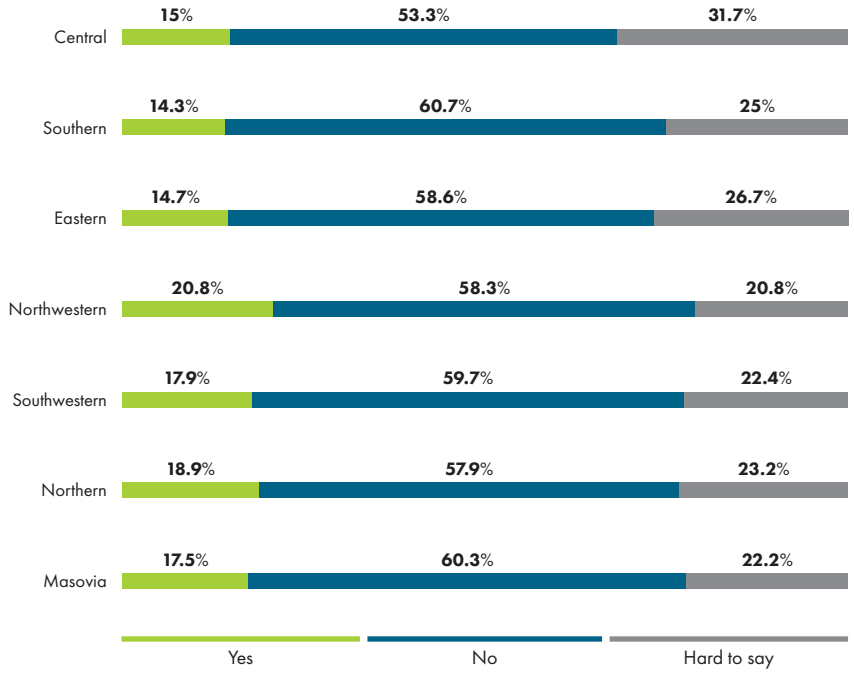
Among those considering migration, the largest group – 19% - are inhabitants of the Masovia province. Admittedly, the region's large population likely influenced that outcome. On the other hand, the smallest percentage comes from the Central and Southwestern regions, as was the case in the previous two editions of our research (2021 and 2022). The share of Southern region residents in the overall pool of potential migrants has fallen by 4 p.p. in the last dozen or so months (as compared to July 2022).

The distribution of answers concerning migration plans is rather similar across all regions. The leave is most often considered in the Northwestern part of the country (with almost 21% of respondents declaring such plans) and least often in the Southern and Eastern regions (approx. 14% each). The Central region (excluding Masovia) demands particular attention – while only 15% of its inhabitants are interested in migration, it also has the least people outright rejecting it, with a third of respondents remaining undecided.

Migration interest in various regions



Percentage of people planning to emigrate from a given region in the entire population



WHO PLANS TO MIGRATE ECONOMICALLY?

Rural and small-town residents more interested in leaving

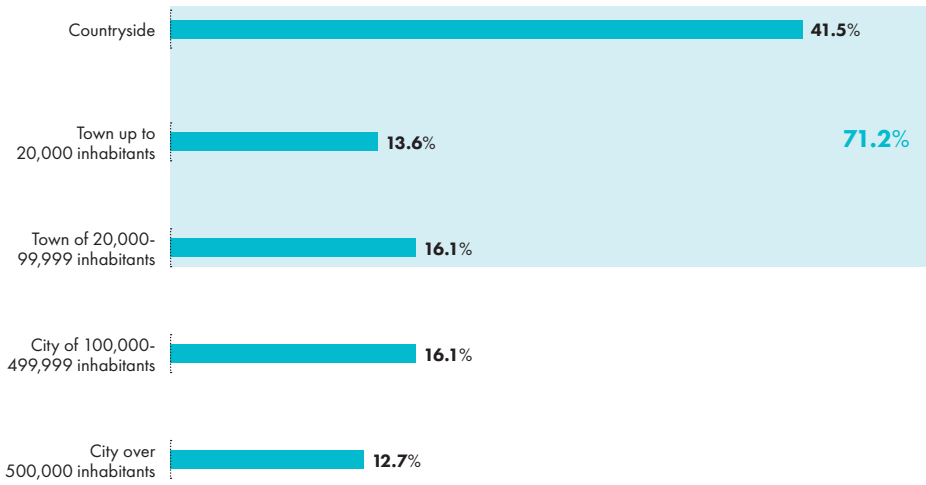
Overall, over 70% of all people considering economic migration are the inhabitants of towns under 100,000 inhabitants. This result is comparable to the previous year's, although we have observed an increased (+ 8 p.p.) interest in migration among rural citizens (42% in the countryside, 30% in towns up to 100,000 residents).

The distribution of data among various class sizes of places of residence. The inhabitants of small towns (up to 20,000 inhabitants) are more likely to consider economic migration – with 21.9% declaring such plans. They are also the group least committed to rejecting such plans. It also bears mentioning that a third of small-town residents remain uncertain – it is the highest percentage under the place of residence criterium.

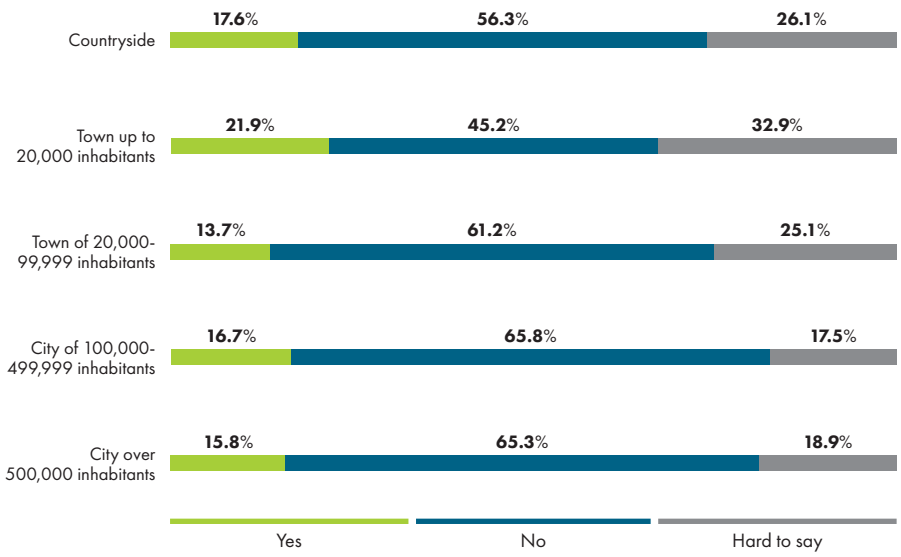
On the other hand, the residents of large cities are the most confident in their current plans and have the highest percentage of people disinterested in leaving (over 65%) and the lowest share of undecided respondents. Such a distribution of results might suggest that the inhabitants of larger cities have a better view of their economic and professional perspectives than the residents of smaller towns, who perceive their economic and professional situation as less certain and thus remain more open to a hypothetical migration.

Are you considering economic migration within the next 12 months?

People considering economic migration – size and status of lace of residence



Migration plans among various places of residence



WHO PLANS TO MIGRATE ECONOMICALLY?

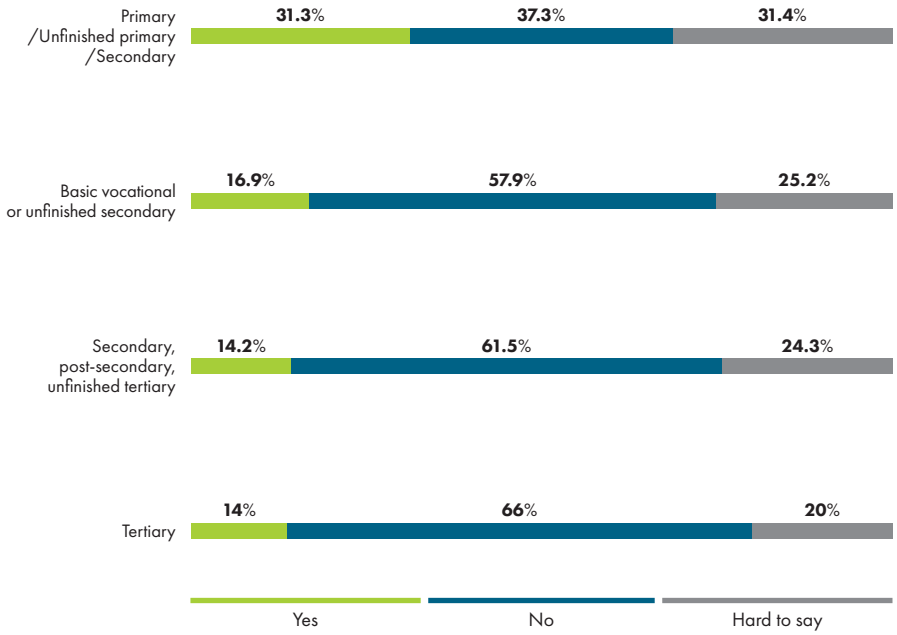
The lower the education, the greater the propensity to leave

The decision to migrate economically is also impacted by one's level of education. People with primary education are the most interested in leaving – with as many as 1/3rd declaring such plans. This group is characterized by the largest percentage of uncertain people – 31%. The higher one's level of education, the lower their interest in migration, paired with more confidence as to their plans. Among people with secondary and tertiary education, over 60% aren't planning to migrate economically. These groups also see a lower share of undecided respondents.

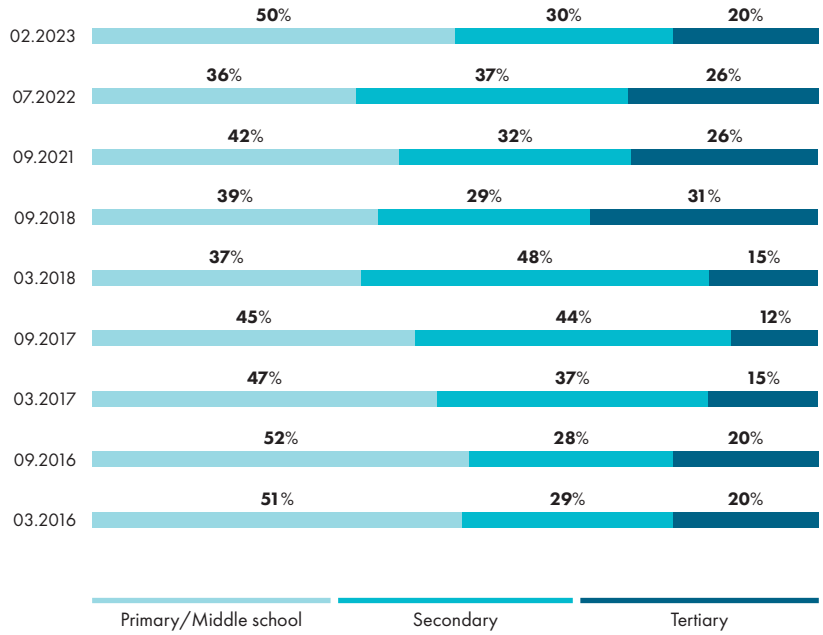
Half of all respondents considering migration have primary or secondary education (22% and 28%, respectively). This is up to 24 p.p. more than in July 2022. A third of all people considering migration have secondary education (30%, -7 p.p. as compared to 2022), and a fifth – tertiary (20%, -6 p.p. as compared to 2022). The results are pointing toward a growing uncertainty regarding the financial and professional situation of the least educated people, for whom potential migration would offer a solution to the current problems.

Are you considering economic migration within the next 12 months?

Migration plans vs. education level



People considering economic migration – education level



WHO PLANS TO MIGRATE ECONOMICALLY?

Production workers most uncertain about their situation

Almost a third of the people considering migration are production/physical employees (29.3%). Lower-ranking employees are also interested in migration, to a slightly smaller extent (20.7%). The relatively high percentage of people employed in leadership positions (18.3%) also piques interest.

Analyzing the answers of employed respondents on various positions, one can notice that migration is most often considered by people in leadership positions, with over 23% declaring plans to move. The lowest interest in migration belongs to senior specialists – with only a tenth of them considering migration and 70% rejecting it outright. The distribution of answers from physical / production employees is quite interesting. This group has the lowest share of people rejecting the possibility of economic migration (51%), with over 16% considering emigration in the coming year. At the same time, a third of respondents remain undecided, which could suggest a high uncertainty towards their own financial and professional situation and the willingness to "wait and see".

Are you considering economic migration within the next 12 months?

*Answers of employed respondents

WHO PLANS TO MIGRATE ECONOMICALLY?

The economic situation has an impact on the propensity to emigration

The willingness to migrate is related to one's income level and the subjective perception of one's material situation. Up to 93% of respondents considering migrations have declared perceiving the effects of worsening domestic economic situation (among the employed, this indicator reached 78%). 70% of the respondents declaring migration plans are earning a net salary under PLN 3,999.

People with a net salary of under PLN 2,999 are both most likely to consider migration and the least frequent to reject the possibility. This group also sees an increased percentage of undecided respondents. The higher the current income, the lower the willingness to migrate. This correlation, however, excludes the biggest earners, with net salaries over 7,000 PLN. While over 70% of respondents in this group don't plan on migrating, at the same time almost 18% are planning to do so in the next 12 months.

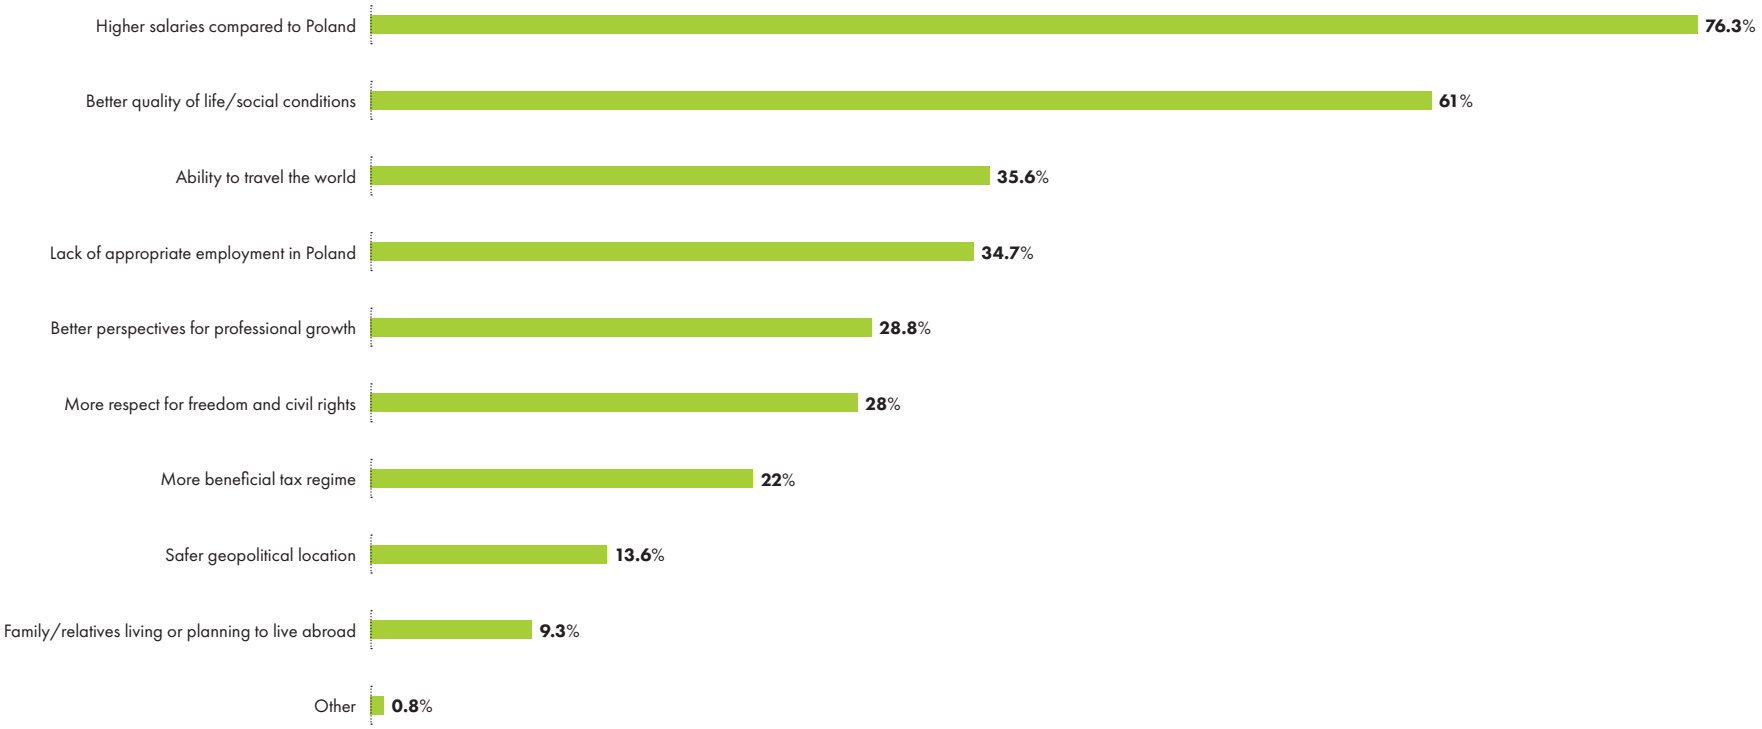
REASONS FOR THE ECONOMIC MIGRATION

The most motivating factors for emigration

The key reasons behind Poles deciding in favor of economic migration have remained unchanged for years – higher salaries (76.3% of respondents) and better quality of life and social conditions (61%). In the last dozen or so months, the number of people pointing out the lack of appropriate employment domestically has greatly risen – this answer was chosen by almost 35% of respondents, an increase of almost 20 p.p. over November 2021. Poles are also valuing non-financial factors. The ability to travel the world is becoming a common motivator for migration (35.6%) – one can observe an upwards trend of +10.6 p.p. as compared to H2 2021 data. Such high values of this indicator were last seen five years ago. A third of all respondents would like to migrate due to greater respect for freedom and civil rights abroad (28%).

Please read through the list of various reasons for leaving Poland, then choose the ones most conductive to your willingness to migrate?



Question asked to respondents planning economic migration

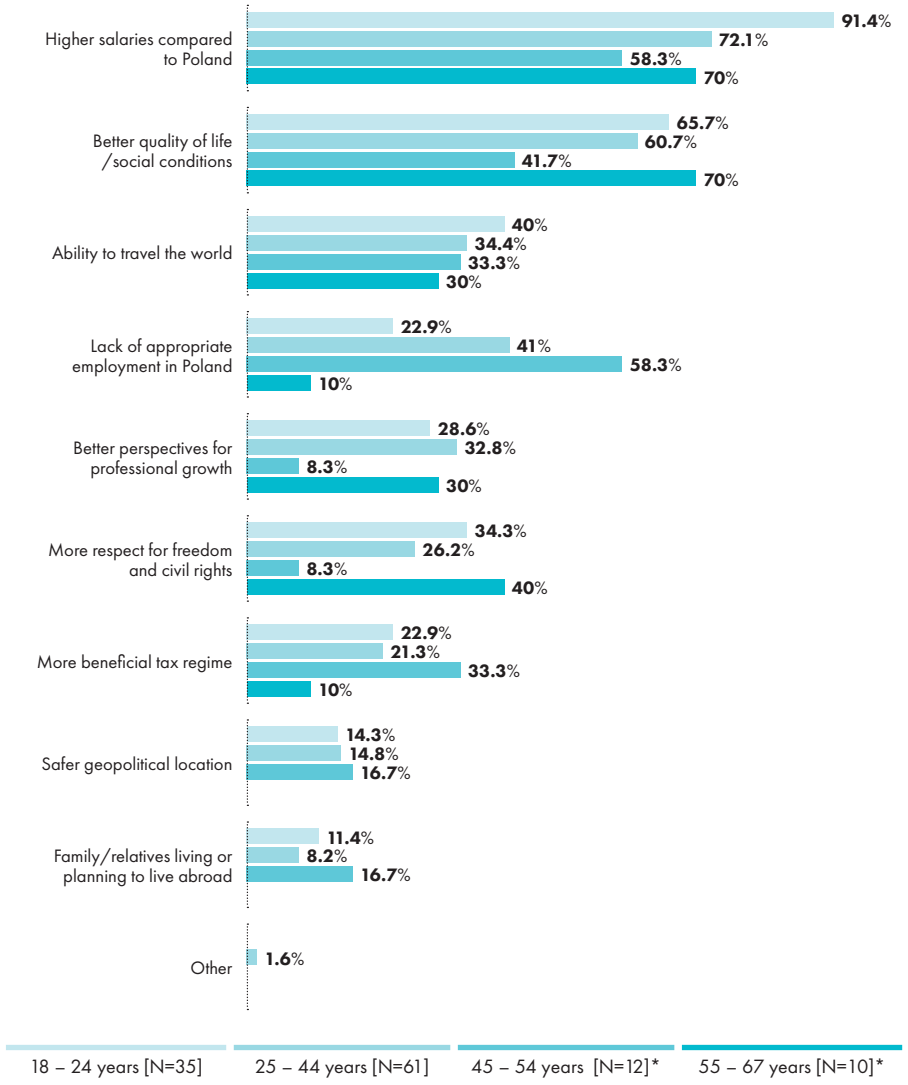
REASONS FOR THE ECONOMIC MIGRATION

Based on age

While the younger generations of Poles are convinced they can expect appropriate jobs of professional growth perspectives, as much as 91% of people aged 18-24 and 72% of people aged 25-44 believe they could earn more abroad. Higher quality of life and social conditions is other major motivator behind migration. The youngest respondents are also putting more importance on traveling the world. A third of respondents belonging to this group believe they could expect greater respect for freedom and civil rights abroad.

While we only had a small sample in the 45-54 age group, we can nevertheless notice certain trends. People in this age are the most likely to point towards greater pay or improved quality of life as the key reasons for leaving abroad. At the same time, a third of respondents are noticing beneficial foreign tax regimes. This is most likely because people in this age group tend to have the highest income and the most stable financial and housing situation. Among people aged 45-54, the most common reasons for migration include conviction of a lack of appropriate jobs in Poland (over 58% of answers – the highest result among all age groups).

Factors motivating migration depending on one's age



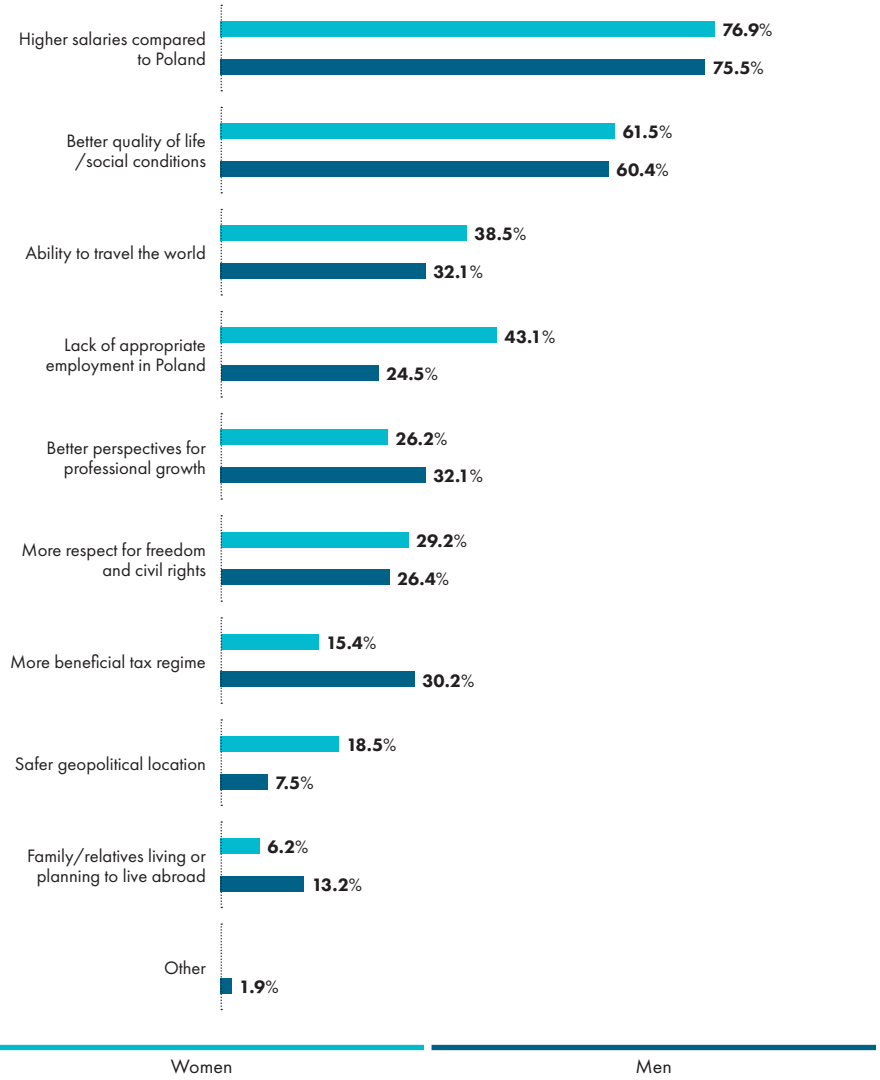
Respondents planning migration
**Low numbers, data is of qualitative nature*

REASONS FOR THE ECONOMIC MIGRATION

Based on gender

The women are much more likely (43% vs 25%) to choose migration, as they cannot find appropriate jobs for themselves in Poland. They are also more convinced by non-professional arguments, such as a safer geopolitical location or greater respect for freedom and civil rights. They are also more interested in traveling the world. Men are more interested in seeking better professional growth perspectives abroad. A third of them are also taking into account the more beneficial tax regimes.

Factors motivating migration depending on one's gender



Respondents planning migration

REASONS FOR THE ECONOMIC MIGRATION

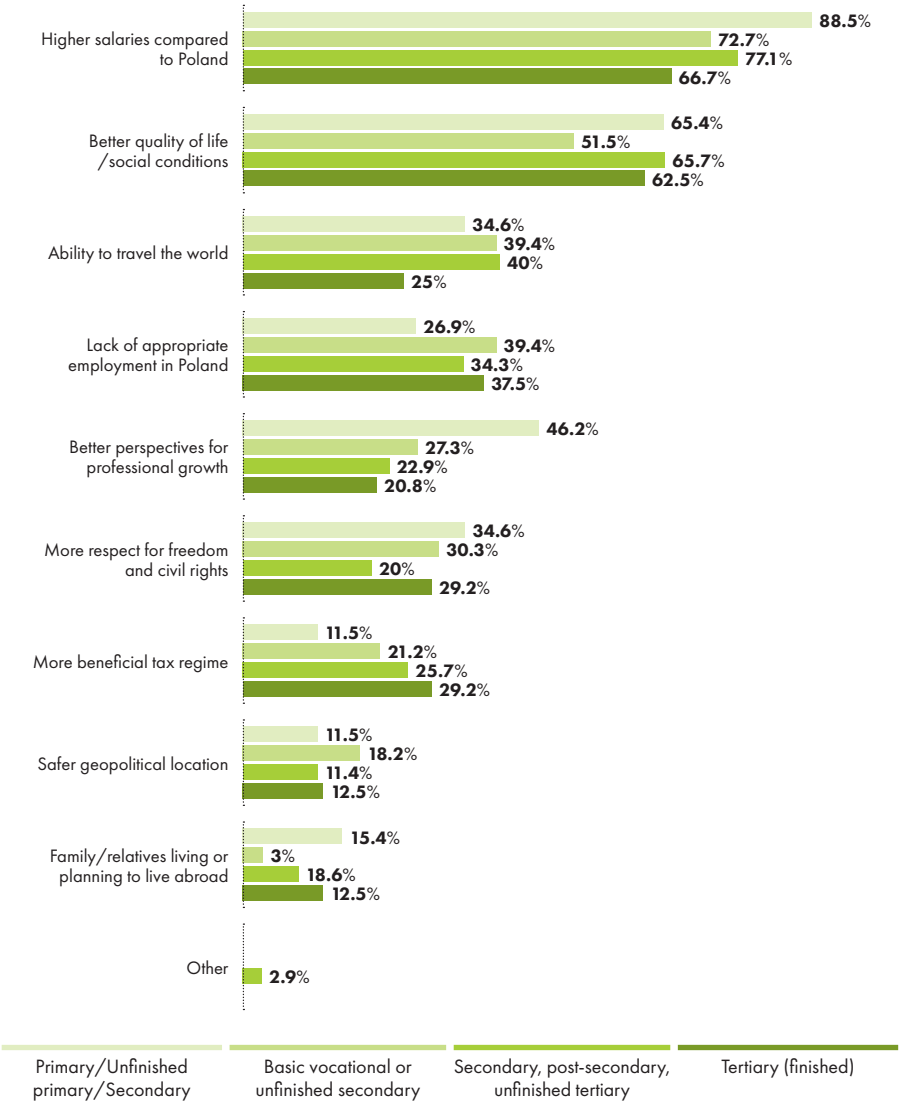
Based on education

People with primary education are looking towards foreign labor markets with hopes for more attractive salaries (up to 88.5%) and higher quality of life (65.4%), as well as better perspectives for professional growth (46.2%).

For people with higher education, financial factors remain the primary reason for leaving, however they're also pointing towards a lack of appropriate jobs in Poland. They are the group least likely to complain about their perspectives on professional growth – perhaps they can also find growth opportunities for themselves domestically. They are also much less motivated by the ability to travel the world – one could expect this need is being satisfactorily fulfilled by holiday excursions.

The higher one's education, the more common their perception (and, likely, awareness) of more beneficial tax regimes abroad.

Factors motivating migration depending on one's education



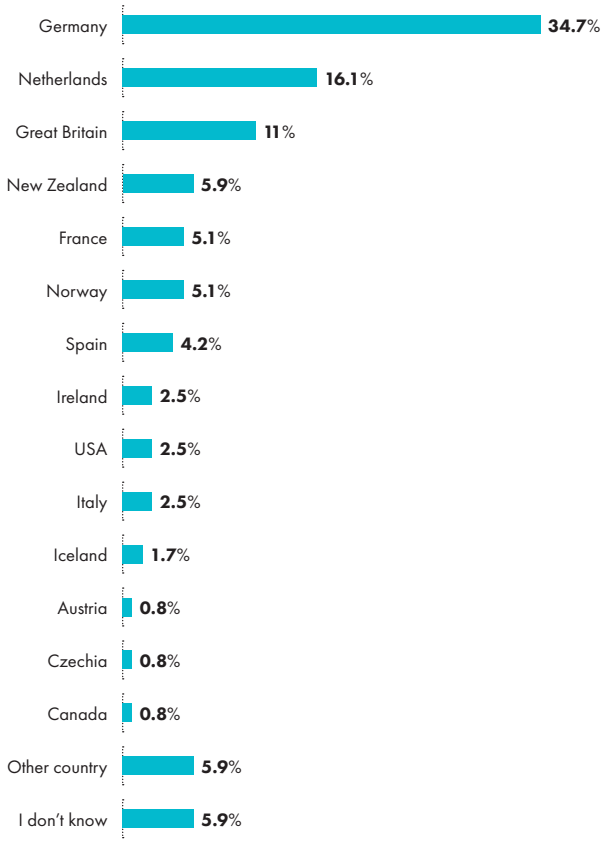
Respondents planning migration

PREFERRED MIGRATION DESTINATIONS

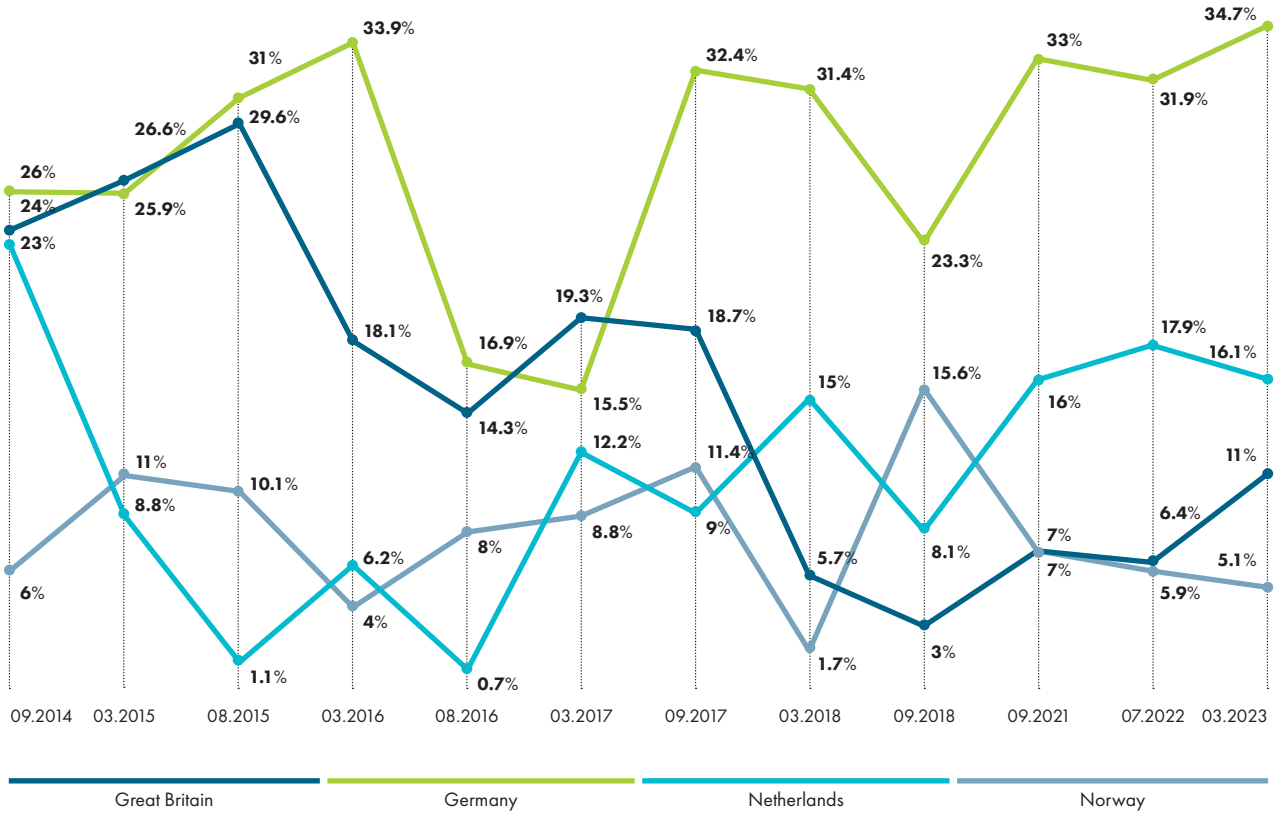
Germany remains on the top

Germany remains the single most popular destination for migrants (almost 35% of answers). Moreover, its popularity has increased compared to the two previous editions of our research (2021 and 2022). The number of people choosing Great Britain has increased once again (+4.6 p.p. as compared to 2021) after a few years of slump. The interest in visiting Netherlands or Norway has slightly decreased compared to the past two years, but nevertheless remains at a similar level. Somewhat unexpectedly, New Zealand rose to fourth place.

What country do you plan on emigrating to?



Preferred migration destinations across years



question asked to respondents planning migration

ECONOMIC MIGRATION

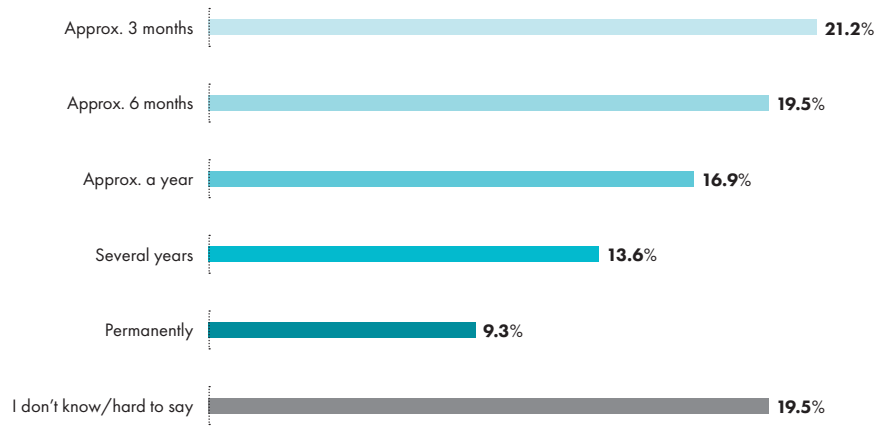
For how long?

In the context of planned migration periods, we have noticed changes as compared to the previous editions of the research. In 2021, plans to leave for several years predominated and 17% of Poles planned to stay abroad permanently. Nowadays, one can see an increased interest in shorter leaves – a fifth of all respondents plan to migrate for only up to half a year. The number of people willing to declare willingness for multi-year stays abroad has fallen greatly – a decrease by 13 p.p. (as compared to 2021) in the former case and by 7.7 p.p. in the latter. It bears mentioning that such a low interest in permanent migration has last been seen in 2016.

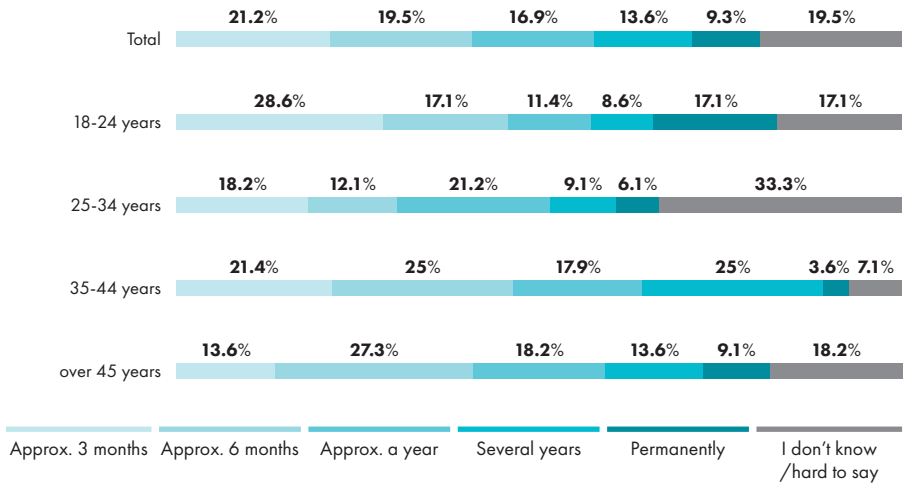
Taking into account the fact most of the respondents declaring a willingness to move abroad does perceive the negative effects of the worsening economic situation domestically, one could presume that many Poles now consider migration as a temporary solution to cushion the negative effects of a recession.

We have also analyzed the interdependence between the length of the planned leave and the age of respondents. In the 18-24 age group plans for short stays abroad predominate, which is most likely due to willingness to take up work in the holiday season. At the same time, the youth are increasingly often considering permanent migration (17% of answers in this group). Among those aged 35-44, plans for long-term migration are predominant, however, a quarter of them wants to migrate for several years. It also bears mentioning the high percentage of people aged 25-34 unsure as to the length of their leave (over 33%).

How long do you plan to stay abroad?



Planned length of migration depending on one's age



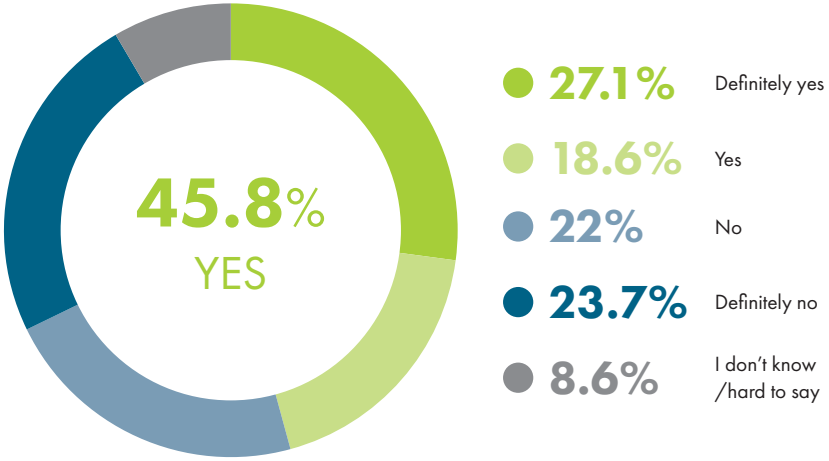
Responses of people considering migration

ECONOMIC MIGRATION

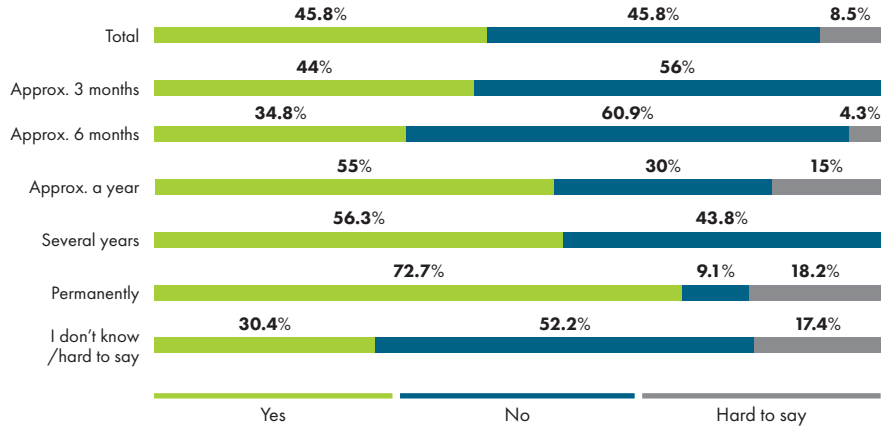
With or without family?

Despite the growing interest in shorter leaves, we can see an upward trend of declaring migration plans together with one's family. In the current edition of the research, as many as 45.8% of respondents are planning to migrate together with their close ones. This marks an increase of 7 p.p. as compared to 2021. At the same time, one can see an increased number of undecided respondents. The number of people planning to leave alone has fallen by 13 p.p. since 2021 (a decrease of 17 p.p. as compared to 2018). Moreover, according to our research migration with one's family concerns not only people planning longer leaves but also many of those considering short-term migration.

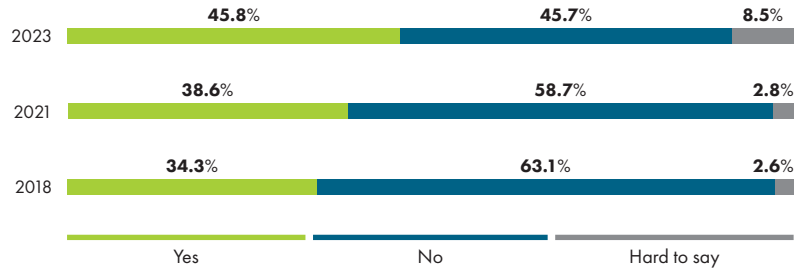
When deciding on migration abroad, are you planning to take your family with you?



Migration with the family vs. the planned length of the stay



When deciding on migration abroad, are you planning to take your family with you?



Question asked to respondents planning migration

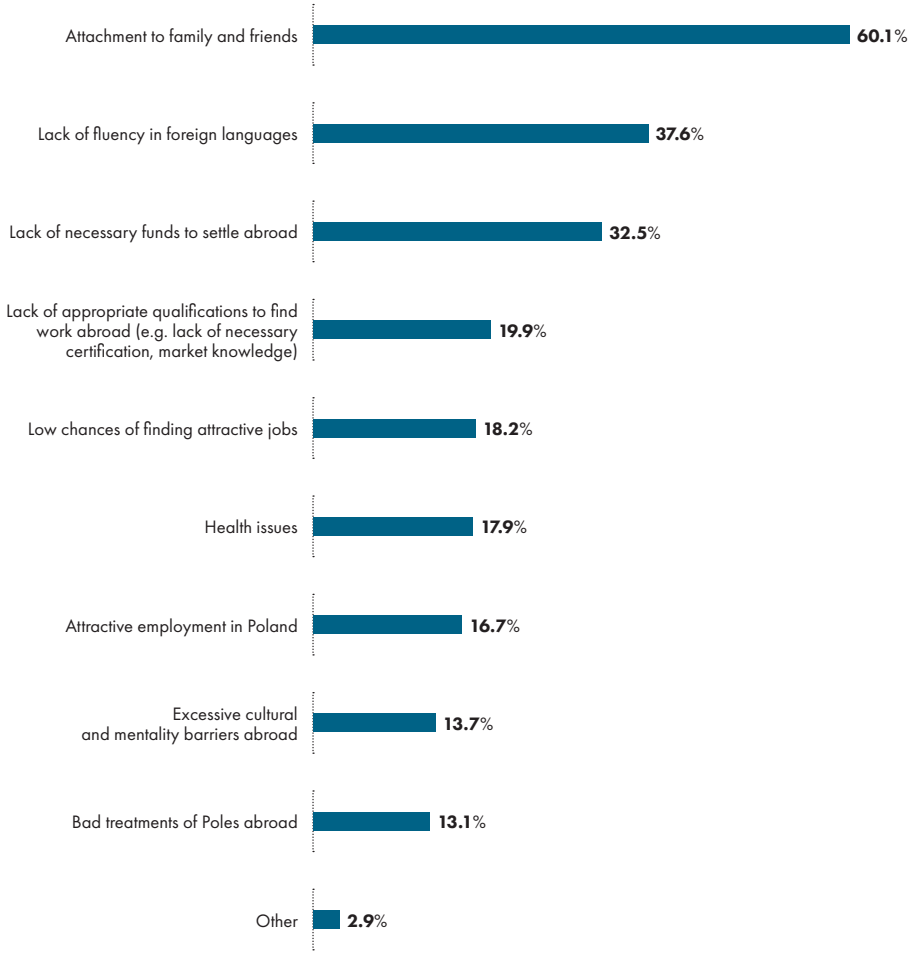
ARGUMENTS FOR STAYING IN THE COUNTRY

For Poles, the attachment towards one's family and friends is the greatest barrier to leaving the country (and, as unveiled by our previous research, also migrations within the country). All age groups, men and women alike, regardless of the place of residence or level of education, have all pointed toward it as the single most important factor. However, we can observe it slowly losing importance over the long term. While we are still far less mobile than Western societies, the data suggests ongoing social changes in this matter.

Lack of fluency in foreign languages is another key factor preventing Poles from migrating (37.6%). This comes as somewhat of a surprise, as this factor has been steadily losing importance over the years. Rather notably, this factor seems to be closely correlated with age, education and the size of the place of residence. The smaller a town, the more likely the language fluency to be considered an obstacle to migration. A similar case concerns the level of education and age of the respondents.

A third of all respondents are also fearful of lacking the necessary funds to settle abroad (32.5%). It also bears mentioning the strong decrease in the number of people not planning to leave due to pre-existing attractive jobs in Poland (16.7% - a decrease by half, from 32.6% in 2021). In the previous editions of this research, it was among the most important factors keeping Poles from migrating. However, it remains quite relevant for the residents of the largest cities, with more than 500,000 residents (22.5%).

Please read through the list of various reasons for staying in Poland, then choose the ones with the biggest impact on preventing you from migration.



Question asked to respondents not planning to migrate

ARGUMENTS FOR STAYING IN THE COUNTRY

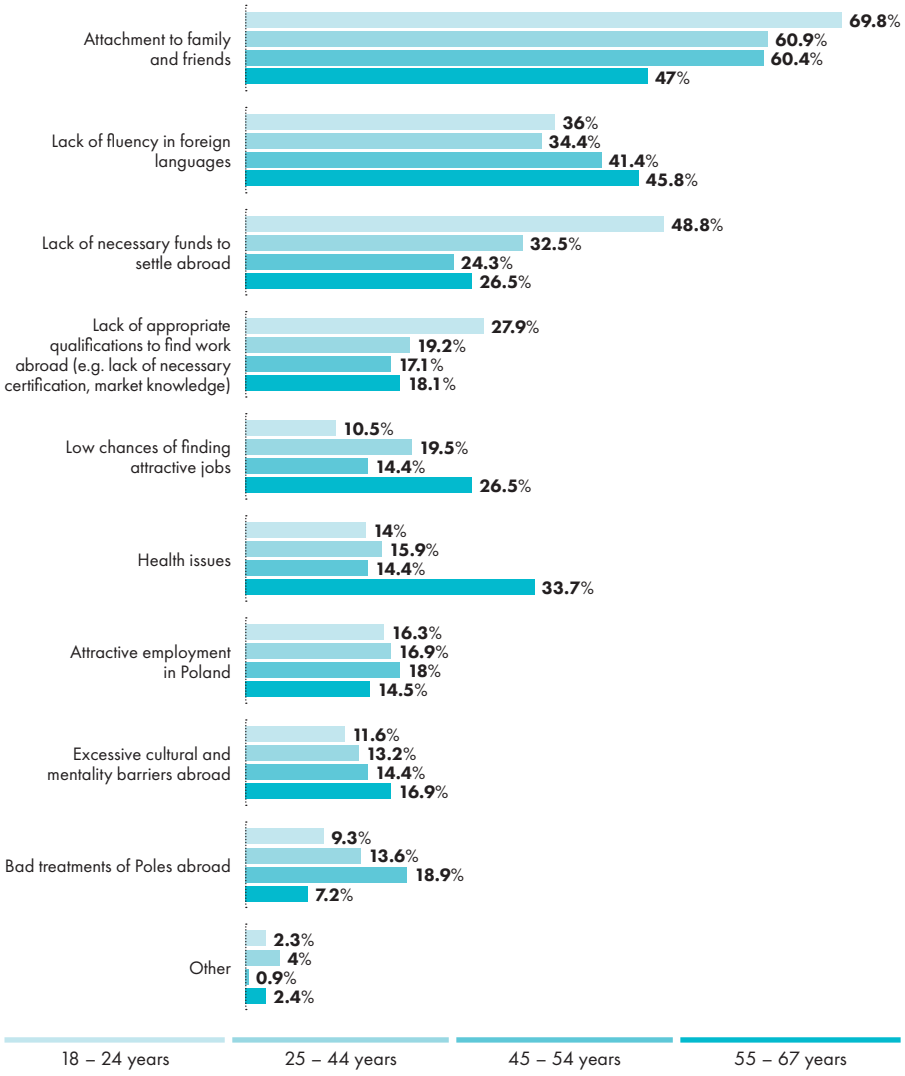
Based on age

Attachment towards one's family and friends is the greatest barrier to leaving – it led to a negative decision in almost 70% of cases. The percentage of respondents pointing towards this factor is decreasing with age, down to a mere 47% for people aged 55-67.

Almost half of the youngest respondents (aged 18-24) also declares lacking the necessary funds to settle abroad (48.8%). This age group is also much more convinced they lack the necessary qualifications to work abroad (27.9%).

For the oldest Poles (above 55 years of age) the greatest barrier to emigration, aside from the above-mentioned lack of fluency in foreign languages (45.8%) are health issues (33.7%) and concerns about finding attractive employment abroad (26.5%).

Barriers to migrate, depending on one's age



Question asked to respondents not planning to migrate

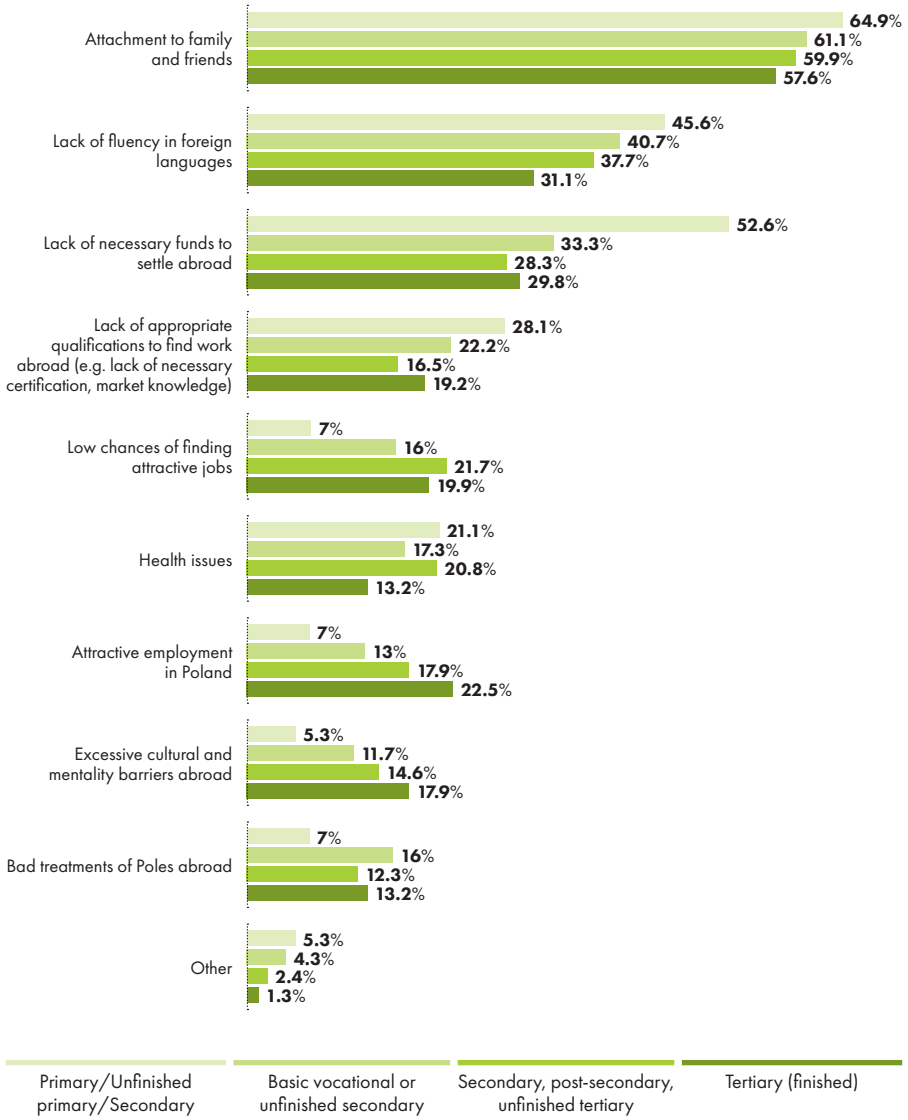
ARGUMENTS FOR STAYING IN THE COUNTRY

Based on education

The number of barriers to hypothetical migration keeps decreasing along with the education levels. Those with primary or vocational education are more likely to point out a lack of fluency in foreign languages and the necessary qualifications to find work abroad. Respondents with primary education are also much more likely to declare a lack of necessary funds to settle abroad (as much as 53% of answers).

The higher one's education, the more relevant having pre-existing attractive job becomes as an argument against leaving. At the same time, it leads to increased concerns about the chances of finding attractive employment abroad, excessive cultural or mentality barriers or bad treatment of Poles abroad. We can assume it to reflect increased awareness of foreign reality abroad.

Barriers to migrate, depending on one's education



Question asked to respondents not planning to migrate

EXPERT VIEW

EXPERT VIEW

Migration plans of Poles: worrying forecasts for the labor market

Robert Lisicki

Head of Labor Department, Konfederacja Lewiatan

The percentage of people considering migration – 17% of respondents – is concerning. Of course, such plans can be of varying nature – permanent or temporary - but nevertheless, a diagnosis of the causes should be taken into account by our country's development policy. Retaining human capital should be of utmost importance.

Data concerning the willingness of Poles to migrate should be understood in the context of demographic forecasts, the age structure of our society and the already perceivable challenges ahead of domestic entrepreneurs. According to the governmental 2040 Demographic Strategy, averaged forecast variation sees Poland's population falling from 37.9 mln in 2019 to 23.0 mln in 2100, a decrease of 39.1%. The forecasts are also indicating a possible decrease in the working-age population, which according to 2019 predictions could decrease from 22.8 mln in 2019 to 10.8 mln in 2100, that is by 52.3%.

The research confirms a notable presence of people up to 34 years of age with vocational, secondary or tertiary education among those who declared readiness to migrate – that is those who oftentimes bring in skills and initiative. At the same time, the economic migration abroad will primarily impact the countryside and smaller towns (71.2%), which could further drive the growing disproportion between the development of Poland's various regions.

The answer to the question of why so many people are still considering moving abroad lies primarily in the quality of life and the economic situation. This is primarily defined by the quality and availability of public services, such as healthcare, childcare centers, education, support in caring for the elderly and disabled, as well as capabilities for fulfilling one's residential needs. One should also bear in mind the issue of legal and economic conditions.

The quality and availability of public services have remained a hot-button topic for many years, with little changing in the meantime. The issues of perceived legal certainty or the conditions for carrying out economic activities are weakening – the perception of a worsening economic situation is confirmed by a majority of those considering migration. The primary reasons for migrating still include better pay (76.3%) and higher quality of life (61%). At the same time, the issues of greater respect for freedom (28%) and a safer geopolitical location (13.6%) have appeared.

The ability to retain human capital is one of the key aspects contributing to a country's attractiveness and growth.

RESEARCH DATA - METHODOLOGY

Purpose of the study:	The main objective of the study was to check the opinions of Polish women and men on economic migration
Research method:	Online interviews (CAWI) through the SW Panel survey portal
Research sample:	The research involved 700 surveys targeting people aged 18-67.
Respondents:	Poles aged 18+, in according to the distribution of gender, age, size of place of residence and education. A sample of people considering economic migration in the next 12 months was selected from the general sample.
Research period:	09/02 – 14/02.2023
